Forever Bright™ LED Holiday Lights

Decorating with holiday lights is becoming more of a year-round activity. As more lighting is used and as energy rates climb, consumers find that decorating with lights is costing more.

There are better ways! Light-emitting diode (LED) lights are an energy efficient patented technology that can reduce your energy costs—particularly when the lights are used for long periods of time, such as in commercial settings.

LEDs are constructed from a tiny solid-state chip similar to those used in computers. These chips directly convert electricity to light without the use of a filament or glass bulb. Instead, the chips are encapsulated in solid plastic that can be made in a variety of shapes and sizes. Basic differences between conventional light bulbs and LEDs are:

- LEDs have no filament to burn out
- LEDs have no glass bulb to break or replace
- LEDs produce relatively no heat
- LEDs produce light in the most efficient method

From the Washington State University

This latest development in decorative lighting technology promises to change the way people decorate their homes, businesses, and even towns for many years to come. Less power consumption, longer product life, and durability without the hazards of excess heat build up, should make the holiday season brighter, safer, and ecologically more sound.

Quik-Klip® Products

A RESOURCE FOR OUTDOOR LIGHTING

#200 Quik-Klip 20 Count, Blister Card/Case Pack 48

#275 Quik-Klip 50 Count, Clam Shell/Case Pack 48
with stainless steel nails.
